

SameView App — 14-Day Closed Testing Report

Testing period: 14 days

Testers: 16 invited testers

Overall Result

The application provides a useful photo-comparison experience that allows users to compare a current photo with a reference photo and track changes over time.

During testing, testers also identified additional useful functionality, including **photo history management and video generation from comparison photos**. These features add value to the core comparison workflow and provide users with more ways to document and review progress.

Overall, the application performed well during testing, and **no critical or blocking issues were identified**. A small number of validation and navigation issues were reported, along with several suggestions for improving shared comparison content and location handling.

Key Features Observed

Testers highlighted the following useful functionality:

- Comparison of reference and current photos.
- History of previously taken/comparison photos.
- Ability to manage photos from history.
- Video generation using comparison photos.
- Progress/comparison visualization over time.

The video-generation feature was also observed during testing and provides an additional way for users to present their photo history and progress.

Key Findings

Location Validation

Bug found

In **Edit Session** → **Location**, the Place Name, City, and Country fields accept arbitrary or meaningless text such as "Xxx", "Yyx", and "Gggg".

Expected result:

Location information should be validated before it is saved.

Recommendation:

Use validated location data where possible. Country selection could use a list of valid countries, with appropriate city/location selection or autocomplete.

Reference and Current Date Validation

Bug found

In **Edit Session**, the application allows the Reference date to be later than the Current photo date.

For example, a Current photo may be dated August 8, 2026, while the Reference date is set to August 9, 2026.

Expected result:

The application should prevent an invalid date order and clearly explain the problem to the user.

Recommendation:

Validate the relationship between Reference and Current dates before saving the session.

Walkthrough Navigation

Bug found

When the user selects **Show walkthrough again** from the How It Works page, completes the walkthrough, and taps **Start** on the final screen, the application returns to the How It Works page instead of opening the main comparison screen.

Expected result:

After completing the walkthrough and selecting Start, the user should be taken directly to the main comparison screen.

Recommendation:

Review the walkthrough completion/navigation flow and ensure the Start action opens the correct destination.

Sharing & Presentation Feedback

Shared Comparison Context

Testers suggested including useful context when a comparison image is shared outside the application.

Possible additions include:

- Reference date.
- Current date.
- A subtle **Reference / Current** or **Before / After** label.

This would help recipients understand the comparison even when the image is viewed without the application.

App Identification on Shared Images

When a comparison image is shared, it is currently shared as a normal image without a visible indication that it was created using the application.

Suggestion:

Consider adding an optional app name, logo, or subtle watermark to shared comparison images.

Location Input Improvement

In addition to validation, testers suggested using a country selector and appropriate city/location selection or autocomplete rather than relying entirely on free-form text.

This would improve data quality and reduce invalid location entries.

Positive Feedback

Testers generally responded positively to the application.

Positive observations included:

- Useful photo-comparison concept.

- Simple progress-tracking workflow.
- History functionality is useful for reviewing previous comparisons.
- Video generation provides an additional way to present progress.
- Photo management through history is convenient.
- No critical or serious functional issues were reported during testing.

Future Suggestions

1. Improve location validation and location selection.
2. Add clearer Reference/Current context to shared images.
3. Consider optional branding or watermarking for shared comparison images.
4. Continue improving the video-generation and history features.
5. Continue regression testing of the walkthrough and comparison workflow after future updates.

Final Assessment

The application provided a **stable and useful photo-comparison experience throughout the 14-day closed testing period.**

Testers identified several issues related to location validation, date validation, and walkthrough navigation, and also provided suggestions for improving shared comparison images and location data quality.

The testing also revealed useful additional functionality, including **photo history management and video generation**, which testers viewed as valuable additions to the core comparison experience.

Final testing assessment: Positive — no critical or blocking issues were identified, with a small number of validation and navigation improvements recommended for future updates.
